

## Coolant Recommendations

Use only high quality ethylene glycol antifreeze containing corrosion protection inhibitors specifically recommended for use in aluminum engines. Check the antifreeze container label.

Use only low-mineral drinking water or distilled water as a part of the coolant solution. Water that is high in mineral content or salt may be harmful to the aluminum engine.

### NOTE:

Using coolant with silicate inhibitors may cause premature wear of water pump seals or blockage of radiator passages. Using tap water may cause engine damage.

The factory provides a 50/50 solution of antifreeze and water in your FOURTRAX. This coolant solution is recommended for most operating temperature and provides good corrosion protection.

Decreasing the concentration of antifreeze to less than 40 % will not provide proper corrosion protection.

Increasing the concentration of antifreeze is not recommended because it decreases cooling system performance. Higher concentrations of antifreeze (up to 60 %) should only be used to provide additional protection against freezing. Check the cooling system frequently during freezing weather.

While reading this manual, remember:

**Indicates a strong possibility that serious injury or death may result if instructions are not followed.**
